Title: Power Line Fire of Big South Fork National River and Recreation Area - 2003

Geospatial\_Data\_Presentation\_Form:

Raster digital data.

Vector data are also available as ArcView Shape Files.

Publication\_Information:

Publication\_Place: Sioux Falls, South Dakota USA

Publisher: U.S. Geological Survey

Description:

Abstract:

The U.S. Geological Survey (USGS) has entered into a cooperative agreement with the National Park Service (NPS) to deliver satellite imagery and derivative products centered on major fires that impact national parks and other federal lands. This data set was compiled at the request of a federal land management agency and is part of a suite of products generated for a specific fire.

See the National Burn Severity Mapping web site at:

[http://edc2.usgs.gov/fsp/severity/fire\\_main.asp](http://edc2.usgs.gov/fsp/severity/fire_main.asp)

Purpose:

The purpose of this project is to develop a robust mapping methodology and consistent data products that allow federal land managers and fire ecologists to evaluate and compare burn severity within individual fires and between fires across various ecosystems. These products will help land managers to more effectively plan, implement and monitor fire recovery activities.

Supplemental\_Information:

Fire Name: Power Line

Agency: National Park Service

Land Management Unit: Big South Fork National River and Recreation Area

Date of Fire: 10/25/2003

Type of assessment: Initial NOTE: This fire was not readily apparent in the differenced Normalized Burn Ratio image. This may be due to the fire not being severe enough to impact the overstory vegetation. Or that the overstory was affected, but the overstory vegetation in both pre and post scenes is in senescence.

Acres within Fire Perimeter: 450 (from NPS information).

Landsat Path and Row: (NOTE: PATH/ROW IS DIFFERENT FOR PRE AND POST FIRE.)

Prefire: 19/35; Postfire 20/35 (Area of overlap used for analysis)

Pre-Fire Landsat Date/Scene ID:

Landsat 5; Nov. 13, 2002/LT5019035000231710

Post-Fire Landsat Date/Scene ID:

Landsat 5; Nov. 23, 2003/LT5020035000332710

Output Dataset Projection: UTM

UTM Zone: 16

Datum Name: NAD83

Spheroid Name: GRS80

Image subset Corner Coordinate

(center of upper left pixel, projection meters)

ULX: 695880 LRX: 713820

ULY: 4049760 LRY: 4031430

Image subset size:

#Rows: 612

#Columns: 599

Pixel size: 30 meters

Bounding Box:

North Lat: 36 34 24 N

South Lat: 36 24 16 N  
East Long: 84 36 37 W  
West Long: 84 48 56 W  
Latitude and Longitude within Fire Perimeter:  
Lat: 36 30 00 N  
Long: 84 43 13 W

Fire Perimeter: Provided by park personnel.

For further information on NLAPS and Landsat TM data,  
please refer to the metadata documentation found on the  
USGS Clearinghouse website at:  
<http://www.fgdc.gov/clearinghouse/clearinghouse.html>

Product List:

poli03a\_pretm.tif  
Pre-Fire Landsat data subset (bands 1-5,7 Geo-TIFF format)

poli03a\_postm.tif  
Post-Fire Landsat data subset (bands 1-5,7 Geo-TIFF format)

poli03a\_dnbr  
Differenced Normalized Burn Ratio (DNBR) subset (ArcInfo GRID)

poli03a\_pi  
Fire Perimeter (shape file)

d203511021103  
Full Scene DNBR (ArcInfo GRID)

Data\_Quality\_Information:

Attribute\_Accuracy:

Attribute\_Accuracy\_Report:

Three on-board calibrators (two solar, one internal) provide an absolute accuracy of 5 percent, excluding band 6.

Logical\_Consistency\_Report:

These Landsat data are collected from a nominal altitude of 705 kilometers in a near-polar, near-circular, sun-synchronous orbit at an inclination of 98.2 degrees, imaging the same 183-km swath of Earth's surface every 16 days.

The pixels representing the bands for the image are in the data set only once.

Completeness\_Report: Fire perimeter was automated, (seed value 425, distance 325) with manual edits.

Positional\_Accuracy:

Horizontal\_Positional\_Accuracy:

Horizontal\_Positional\_Accuracy\_Report:

Energy reflected from Earth's surface passes through a whisk-broom scanning system and all-reflective optics before being collected by the solid-state detectors at the focal plane.

Lineage:

Process\_Step:

Process\_Description:

These data products are derived from Landsat Thematic Mapper data.

A pre-fire scene and a post-fire scene are analyzed to create a Differenced Normalized Burn Ratio (DNBR) image. The DNBR image portrays the variations of burn severity within the fire.

The Landsat images are terrain corrected and geometrically rectified to an Albers Conical Equal Area map projection using the National Landsat Archive Production System (NLAPS). The images are further processed to convert bands 1-5 and 7 to at-satellite-reflectance. The Normalized Burn Ratio (NBR) is computed for each date of imagery using the following formula:

(Band 4 - Band 7) / (Band 4 + Band 7) = NBR

The differenced NBR is computed by subtracting the post-fire NBR from the pre-fire NBR:

PreNBR - PostNBR = DNBR

Higher DNBR values are correlated with more severe burns. The DNBR image is evaluated to determine the threshold value between burned and unburned areas. The perimeter of the fire is delineated using the DNBR image. The DNBR image, the pre-fire and post-fire TM images, and a fire perimeter vector file are provided in digital format in the map projection used by the National Park Service.
