Description:
 Abstract:
Monitoring Trends in Burn Severity (MTBS) is a multi-year project conducted
through a partnership between the USGS EROS and the USDA Forest Service Remote
Sensing Applications Center (RSAC). It is designed to consistently map the burn
severity and perimeters of fires across all lands of the United States for the
period spanning 1984 through 2010. MTBS is based on image processing and
analysis methods currently utilized by the USGS and USFS for existing post-fire
burn severity mapping efforts. The USGS Landsat Thematic Mapper image archive
will provide a consistent and continuous source of 30 meter resolution data
going back to 1984 for mapping burn severity of all fires greater than 1000
acres in the west and 500 acres in the east (east of 97W longitude).
 Purpose:
The data generated by MTBS will be used to identify national trends in burn
severity, providing information necessary to monitor the effectiveness of the
National Fire Plan and Healthy Forests Restoration Act. MTBS is sponsored by the
Wildland Fire Leadership Council (WFLC), a multi-agency oversight group
responsible for implementing and coordinating the National Fire Plan and Federal
Wildland Fire Management Policies. The MTBS project objective is to provide
consistent, 30 meter resolution burn severity data and fire perimeters that will
serve four primary user groups:1. National policies and policy makers such as
the National Fire Plan and WFLC which require information about long-term trends
in burn severity and recent burn severity impacts within vegetation types, fuel
models, condition classes, and land management activities.2. Field management
units that benefit from mid to broad scale GIS-ready maps and data for pre- and
post-fire assessment and monitoring. Field units that require finer scale burn
severity data will also benefit from increased efficiency, reduced costs, and
data consistency by starting with MTBS data.3. Existing databases from other
comparably scaled programs, such as Fire Regime and Condition Class (FRCC)
within LANDFIRE, that will benefit from MTBS data for validation and updating of
geospatial data sets.4. Academic and agency research entities interested in fire
severity data over significant geographic and temporal extents.
Supplemental_Information:
The MTBS Fire-ID is generated by combining several attributes taken from Federal
or State agency fire records.The first field is the Federal Agency or State
identification, next is a code related to the sub unit of the reporting agency
(i.e. specific forest, park, refuge, etc.), next is the agency code given to the
individual fire, and lastly is the start date of the fire in the format: year
month day.NOTES: some of the fields were not recorded for some fires. Records
from different agencies contain different formats or incomplete information for
the date of the fire.Multiple agencies report the same fire, preferentially; a
Federal agency record was used to identify a fire and duplicate MTBS fire IDs
are also noted below.Fires that were discovered with no corresponding fire

record and met the fire size criteria were mapped and given an ?unknown?, ?state? or ?agency? Fire-ID if it can be determined and a latitude, longitude and estimated start date: Unk-ddmmss-dddmmss-yyyymmddThe first ddmmss field refers to the north latitude of the fire centroid.The second dddmmss field refers to the west longitude of the fire centroid.The date field is the best estimate of the fire start date.NOTE: An unknown fire may, in fact, have a corresponding fire record, but the fire record contains the wrong location and/or year of occurrence and could not be matched with the fire found on the Landsat imagery.

Supplemental Fire Metadata

Fire Information
MTBS Fire ID: FWS-INNO-DP3D-20070610
Duplicate MTBS Fire IDs: No duplicate fire IDs
Fire Name (if known): HORSEFLY
Date of Fire: June 10, 2007
State: Alaska
Agency: USFWS
MTBS Mapping Zone: Alaska
Geographic Area: Alaska
HUC4 Catalog Unit: 19040803
Type of Assessment: Extended
Acres within Fire Perimeter: 2277.0

Required spatial adjustment for co-registration of pre-fire NBR to post-fire NBR
X-shift adjustment: -30 meters (relative to post-fire NBR)
Y-shift adjustment: 0 meters (relative to post-fire NBR)

Landsat Path and Row: 74/16
Pre-Fire Landsat Date/Scene ID: Landsat 5 TM; July 04, 2006 / 5074016000618550
Post-Fire Landsat Date/Scene ID: Landsat 5 TM; June 07, 2008 / 5074016000815950

Output Dataset Projection Albers Equal Area
Units: Meters
Datum: WGS84
Spheroid: WGS84
1st Standard Parallel: 55 00 00
2nd Standard Parallel: 65 00 00
Central Meridian: -154 00 00
Latitude of Origin: 50 00 00
False Northing: 0
False Easting: 0

Image Subset Corner Coordinates (center of pixel, projected meters)

Latitude: 62.979088 (62 58 44.7168)
Longitude: -157.73378 (-157 44 01.60799999999)

Fire Perimeter Generation Method: Manual

dNBR offset value used to calculate RdNBR: 133

Burn severity thresholds
No Data Threshold: -970
Increased Greeness: -150
Low Threshold: 175
Moderate Threshold: 332
High Threshold: 550

Product List:
FWS-INNO-DP3D-20070610_pre_refl.tif
Subset of Landsat scene used for pre-fire image (Bands 1-5, 7; Unsigned 8-bit
GeoTIFF)

FWS-INNO-DP3D-20070610_post_refl.tif
Subset of Landsat scene used for post-fire image (Bands 1-5, 7; Unsigned 8-bit
GeoTIFF)

FWS-INNO-DP3D-20070610_d.tif
dNBR used for burn severity analysis and mapping; subset to the fire area
(Signed 16-bit GeoTIFF)

FWS-INNO-DP3D-20070610_dt.tif
Thematic dNBR; Derived by thresholding dNBR subset (8-bit GeoTIFF)

FWS-INNO-DP3D-20070610_rd.tif
Relative dNBR; subset to the fire area (Signed 16-bit GeoTIFF)

FWS-INNO-DP3D-20070610.shp
Perimeter of detectable fire area derived from satellite imagery (ESRI
shapefile)

FWS-INNO-DP3D-20070610_cldshdw.shp
Mask for clouds, shadow, snow or anomallies intersecting fire area (ESRI
shapefile)

d7416_20060704_7416_20080607.tif
dNBR for full Landsat scene (path/row: 74/16)

Processing Comments: not the best phenological match, prefire image much
greener than post fire

Data_Quality_Information:
Attribute_Accuracy: Attribute_Accuracy_Report: MTBS geospatial data (both vector
and raster) are generated using consistent methods and procedures. The
differenced Normalized Burn Ratio (dNBR) image datasets are examined on a fire
by fire basis to develop a thresholded, or categorical, burn severity dataset.
Quantitative_Attribute_Accuracy_Assessment:
Attribute_Accuracy_Explanation: MTBS analysts examine the differenced Normalized
Burn Ratio (dNBR) image for each fire in the context of remote sensing spectral
data and any ancillary information available to the analyst. dNBR image data
for each fire are thresholded into classes representing unburned areas; areas of
low, moderate, high burn severities; and areas of increased vegetation response.
Analysts follow guidelines established by subject matter experts in order to
maintain consistency in discerning burn severity thresholds from fire to fire
and minimize subjectivity.
Logical_Consistency_Report: These Landsat data are collected from a nominal
altitude of 705 kilometers in a near-polar, near-circular, sun-synchronous orbit
at an inclination of 98.2 degrees, imaging the same 183-km swath of Earth's
surface every 16 days. The pixels representing the bands for the image are in
the data set only once.
Completeness_Report: Fire Perimeter Generation Method: Manual (from metadata)
Positional_Accuracy:
Horizontal_Positional_Accuracy:
Horizontal_Positional_Accuracy_Report: Each Landsat Thematic Mapper image used
to create the burn severity assessment was precision terrain-corrected using 3-
arc-second digital terrain elevation data (DTED), and georegistered using ground
control points. This resulted in a root mean square registration error of less
than 1 pixel (30 meters).Lineage:
Process_Step:
Process_Description: These data products are derived from Landsat Thematic
Mapper data. A pre-fire scene and a post-fire scene are analyzed to create a
Differenced Normalized Burn Ratio (dNBR) image. The dNBR image portrays the
variations of burn severity within the fire.

The Landsat images are terrain corrected and geometrically rectifiedto an Albers
Conical Equal Area map projection using the National Landsat Archive Production
System (NLAPS). The images are further processed to convert bands 1-5 and 7 to
at-satellite-reflectance. The Normalized Burn Ratio (NBR) is computed for each
date of imagery using the following formula:

((Band 4 - Band 7) / (Band 4 + Band 7)) x 1000 = NBR

The differenced NBR is computed by subtracting the post-fire NBR from the pre-
fire NBR:

PreNBR - PostNBR = dNBR

Further processing is required to generate the 'Relativized' dNBR (RdNBR). The RdNBR takes into account pre fire conditions related to the amount of vegetation cover vs. bare soil. In one sense, an area of 25% vegetation cover that burns completely should be considered 'high severity' as would an area of 100% cover that burned completely. The dNBR does not allow that distinction. To calculate the RdNBR, the analyst must determine the 'dNBR offset value': the average dNBR value of a nearby area of unburned vegetation (similar to the vegetation that did burn). The RdNBR is calculated as follows:

(dNBR - dNBROffset)/ (Square Root of (PreNBR/1000)) = RdNBR

Higher dNBR and RdNBR values are correlated with more severe burns. The dNBR image is evaluated to determine the threshold value between burned and unburned areas. The perimeter of the fire is delineated using the dNBR and/or post-fire reflectance image. The dNBR image, the pre-fire and post-fire TM images, and a fire perimeter vector file are provided in digital format.
