Description:

Abstract:

The U.S. Geological Survey (USGS) has entered into a cooperative agreement with the National Park Service (NPS) to deliver satellite imagery and derivative products centered on major fires that impact national parks and other federal lands. This data set was compiled at the request of a federal land management agency and is part of a suite of products generated for a specific fire.

See the National Burn Severity Mapping web site at:

http://edc2.usgs.gov/fsp/severity/fire_main.asp

Purpose:

The purpose of this project is to develop a robust mapping methodology and consistent data products that allow federal land managers and fire ecologists to evaluate and compare burn severity within individual fires and between fires across various ecosystems. These products will help land managers to more effectively plan, implement and monitor fire recovery activities.

Supplemental_Information:

Fire Name: East Side Complex

Agency: National Park Service

Land Management Unit: Little River Canyon National Preserve

Date of Fire: 3/10/2007

Type of assessment: Initial

Acres within Fire Perimeter: 2110

Landsat Path and Row: 20/36

Pre-Fire Landsat Date/Scene ID:

Landsat 5; June 24, 2006/LT5020036000617510

Post-Fire Landsat Date/Scene ID:

landsat 5; May 26, 2007/LT5020036000714610

Perimeter Scene Data/ Scene ID:

landsat 5; Apr. 8, 2007/LT5020036000709810

Output Dataset Projection: UTM

UTM Zone: 16

Datum Name: WGS84

Spheroid Name: WGS84

Image subset Corner Coordinate (center of upper left pixel, projection meters)

ULX: 618060 LRX: 633240

ULY: 3821310 LRY: 3792510

Image subset size:

#Rows: 961

#Columns: 507

Pixel size: 30 meters

Bounding Box:

North Lat: 34 31 33 N

South Lat: 34 15 58 N

East Long: 85 33 01 W

West Long: 85 42 57 W

Latitude and Longitude within Fire Perimeter:

Lat: 34 25 00 N

Long: 85 35 35 W

Fire Perimeter: Digitized from Landsat scene (April 8, 2007)

For further information on NLAPS and Landsat TM data, please refer to the metadata documentation found on the USGS Clearinghouse website at:

<http://www.fgdc.gov/clearinghouse/clearinghouse.html>

Product List:

easi07a_pretm.tif

June/2006 Pre-Fire Landsat data subset (bands 1-5,7 Geo-TIFF format)

easi07a_perimtm.tif

April/2007 Perimeter Landsat scene (included in easi07a_postm.zip)

easi07a_postm.tif

May/2007 Post-Fire Landsat data subset (bands 1-5,7 Geo-TIFF format)

easi07a_dnbr

Differenced Normalized Burn Ratio (DNBR) subset (16 bit ArcInfo GRID)

easi07a_pi, easi07a_cldshdw

Fire Perimeter and clouds and shadow mask (shape files)

easi07a_hist.xls

DNBR pixel count within the fire perimeter (excel file)

d203606060507

Month/year - Month/Year Full Scene DNBR (16 bit ArcInfo GRID)

Data_Quality_Information:

Attribute_Accuracy:

Attribute_Accuracy_Report:

Three on-board calibrators (two solar, one internal) provide an absolute accuracy of 5 percent, excluding band 6.

Logical_Consistency_Report:

These Landsat data are collected from a nominal altitude of 705 kilometers in a near-polar, near-circular, sun-synchronous orbit at an inclination of 98.2 degrees, imaging the same 183-km swath of Earth's surface every 16 days. The pixels representing the bands for the image are in the data set only once.

Completeness_Report: Fire perimeter was automated, (seed value 425, distance 325) with manual edits.

Positional_Accuracy:

Horizontal_Positional_Accuracy:

Horizontal_Positional_Accuracy_Report:

Energy reflected from Earth's surface passes through a whisk-broom scanning system and all-reflective optics before being collected by the solid-state detectors at the focal plane.

Lineage:

Process_Step:

Process_Description:

These data products are derived from Landsat Thematic Mapper data. A pre-fire scene and a post-fire scene are analyzed to create a Differenced Normalized Burn Ratio (DNBR) image. The DNBR image portrays the variations of burn severity within the fire.

The Landsat images are terrain corrected and geometrically rectified to an Albers Conical Equal Area map projection using the National Landsat Archive Production System (NLAPS). The images are further processed to convert bands 1-5 and 7 to at-satellite-reflectance. The Normalized Burn Ratio (NBR) is computed for each date of imagery using the following formula:
$$(\text{Band 4} - \text{Band 7}) / (\text{Band 4} + \text{Band 7}) = \text{NBR}$$

The differenced NBR is computed by subtracting the post-fire NBR from the pre-fire NBR:
$$\text{PreNBR} - \text{PostNBR} = \text{DNBR}$$

Higher DNBR values are correlated with more severe burns. The DNBR image is evaluated to determine the threshold value between burned and unburned areas. The perimeter of the fire is delineated using the DNBR image. The DNBR image, the pre-fire and post-fire TM images, and a fire perimeter vector file are provided in digital format in the map projection used by the National Park Service.
