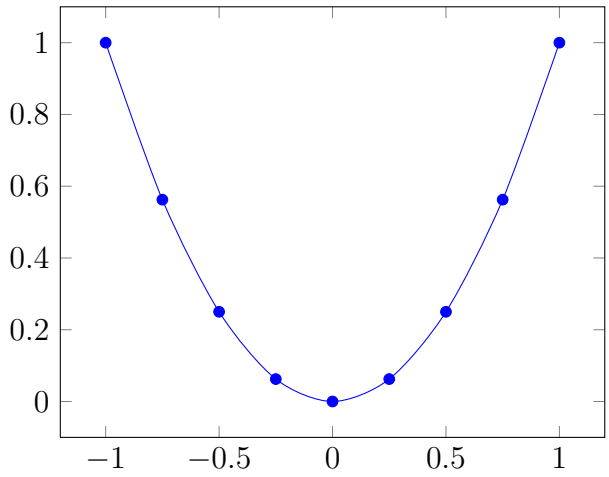
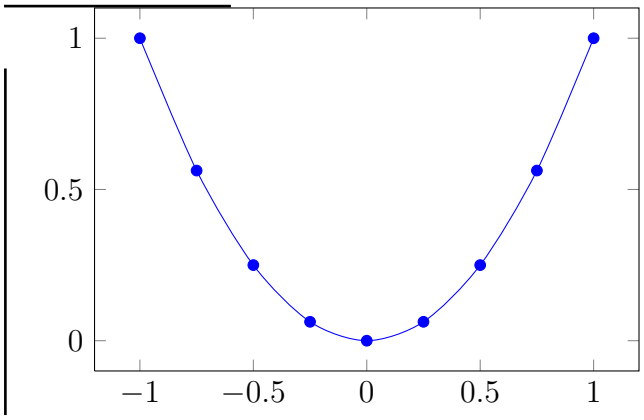
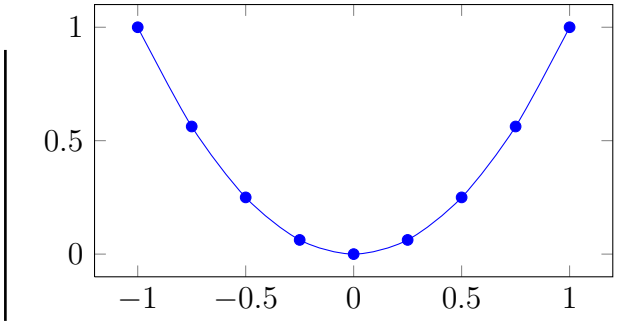
7.2.3 x=3cm



7.2.4 x=3cm, y=4cm



7.2.5 y=3cm

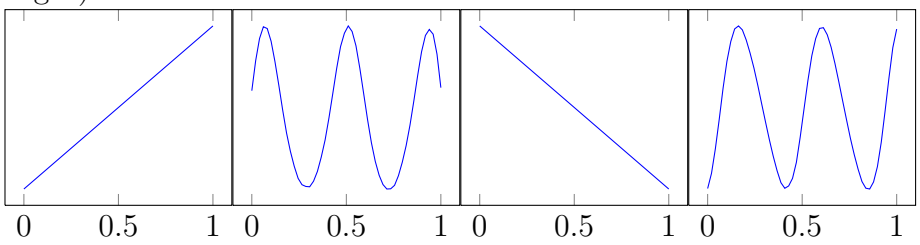


7.2.6 Scale vs. Datascale trafo

All should have the same size; especially the same height. This tests the data scale transformation and rounding inaccuracies during the computation of x and y unit vectors,

$$x = \frac{W}{T(\bar{x}) - T(\underline{x})}.$$

The larger x, the higher the scaling accuracy. Large x means small $T(\bar{x}) - T(\underline{x})$ (relative to width W). But this implies low accuracy for the input data! And nobody wants inaccurate plots.
The datascale transformation T is set up such that $O(W) = O(x)$, but I am not sure if I need to adjust some parameters. Some parameters lead to inaccurate x and y vectors, such that axis sizes are not the same although W and H (width and height) are the same.



once more again without ‘scale only axis’:
