Prof. Dr. **Till Tantau**
`tantau at users.sourceforge.net`

Dear Sir,

Here are some arrow tips for drawing database entity diagrams.

(The first attempt to send you them I made on March 16, 2006 but the mail was rejected due to overfull of your mailbox.)

(At *this* attempt the sourceforge.net server rejects mails with .zip attachments :-))

(At the project's site I didn't see any encouragement for contributions other than becoming a Developer which is not the case here, I suppose.

I mean, if you'd be interested in these arrow tips and wanted me to describe them a bit more, I'd still remain just a tikz user.)

I think they may be useful for someone else. If there's no such arrow tips defined yet it would be an honour for me to see this humble package included into the `pgf` bundle.

The 'nulla' arrow tip advisability
I think something like `nulla` arrow would be useful in general (like Zero or Null are sometimes useful ;-) e.g., to straighten an ending of a curve (compare my arrows with `angle 60` drawn last above).

I think there could be some standard arrow tips defined with a straight segment in their middle so that they not look like last arrowcurve above but like this:

Once again thanks for a good work.

Yours sincerely and TEXnically,
Natror (Grzegorz Murzynowski)
